

Executive Report: NovaTech Revenue Intelligence Dashboard

- **Date:** 13 September 2026
- **Written by:** Eric Jang, Business Intelligence Analyst
- **Prepared for:** Sarah Chen, VP of Revenue
- **Purpose:** Revenue Intelligence Dashboard review and recommended actions

Executive overview

NovaTech's revenue team currently relies on three separate systems for sales, marketing and customer support. This fragmentation requires the team to manually combine reports each Monday, consuming roughly an hour every week while still making cross-functional questions difficult to answer. The Revenue Intelligence Dashboard addresses this problem by bringing the customer journey into three connected views: **Marketing Funnel, Sales Pipeline and Customer Health**, with natural-language access through Amazon Quick Chat.

The dashboard has been designed around the questions that matter most to the Revenue team: *which marketing investments convert, where sales performance is strongest or slowing, and which customers or product areas represent the greatest retention risk*. It deliberately focuses on current and historical performance rather than forecasting, consistent with the requirement for weekly rather than real-time data.

Data strategy

The solution combines three source datasets: **499 CRM deals, 2,240 marketing leads and 3,000 support tickets**. All three share **Account ID**, which provides the common identifier needed to connect marketing activity, sales outcomes and support experience. NovaTech's core CRM contains 85 accounts, while the marketing and support systems contain an additional 15 account IDs that do not appear in CRM. These records remain useful within their respective marketing and support views, but cannot be linked to recorded deal revenue.

The datasets were prepared in **SPICE**, Amazon Quick's in-memory data storage, used to provide fast dashboard performance. Data preparation included validation of record counts, dates and missing values, correction of data types and creation of business measures such as *days to close*, *campaign return on investment* and *ticket resolution time*. The validation process also highlighted data-quality considerations, including missing support resolution dates and differences between documented and observed values that should continue to be monitored.

For the combined dataset, a fourth dataset, support tickets data was used as the anchor and marketing and CRM deals data were attached using the customers' Account ID. This preserves every sales deal while enabling cross-functional account analysis. Because one

customer may have multiple deals, leads and tickets, the joined dataset expands to approximately **63,420 deal-lead-ticket combinations from 499 deals**.

To prevent inflated revenue or ticket volume, a simpler data joining strategy was implemented: CRM and marketing datasets were summarised into one record per customer account, and then connected those summaries to the support-ticket data. This kept the combined dataset manageable while still allowing Sarah to compare sales, marketing and support information for the same customers.

Dashboard design and business findings

The **Marketing Funnel** view reveals how campaign investment translates into leads, responses and closed-won outcomes. The dashboard tracks **2,240 leads, \$12.36M of campaign spend and \$1.13M of attributed revenue**, producing an overall campaign return of investment (ROI) of **-90.88%**. The funnel records 412 closed-won leads, equivalent to an **18.39% lead-to-closed-won conversion rate**.

Channel efficiency varies substantially. **Direct Mail converts 48.99% of leads**, considerably ahead of Partner Referral at 31.1%. NovaPulse Launch is the strongest individual campaign by closed-won volume and generated approximately **\$394K in attributed revenue**. In contrast, **NovaEdge Awareness is the clearest candidate for intervention**: it consumes approximately \$1.52M of spend while producing only about \$34K in attributed revenue, with a 6.2% response rate and approximately 5.1% conversion. The recommended action is to reduce or pause NovaEdge Awareness and model a controlled reallocation towards stronger campaign and channel combinations. The dashboard annotation assigns the modelling to Marketing and approval to the VP of Revenue for the next campaign cycle.

The **Sales Pipeline** view tracks **499 deals**, with a **63.13% win rate, \$707.20K in won revenue** and an average won deal value of approximately **\$2,245**. Enterprise and Large customers contribute the majority of revenue, at approximately \$319K and \$272K respectively, while NovaPulse Professional is the leading product at approximately \$209K.

The principal sales concern is deal velocity. Average days to close reached **90.1 days in Q1 2025**, compared with 51.5 days in Q1 2024, representing an increase of approximately 75% year on year. Longer cycles delay revenue and increase the likelihood that opportunities stall. In addition, *No Decision Made* and *Poor Product Fit* are the leading loss reasons, with 43 deals each. The recommended response is to introduce stage-age alerts and manager review for opportunities exceeding 60 days, alongside stronger qualification of product fit earlier in the sales process.

The **Customer Health** view highlights operational risks that are less visible in the existing revenue process. Across **3,000 tickets**, the dashboard records **50 critical tickets, 59 open tickets and 22.8% negative sentiment**. Average resolution time is approximately 58 hours and changes little between priority levels, indicating that urgent issues are not being resolved materially faster than low-priority cases.

More importantly, **Authentication and Data Pipeline account for 279 of the 450 high-severity tickets, or 62%, despite representing only 29.7% of total ticket volume**. These product areas can block customer access or disrupt core workflows, increasing both

negative sentiment and churn exposure. They should therefore be treated as Priority 0 (P0) reliability priorities, with tighter critical-ticket service levels and coordinated Engineering and Support ownership.

Natural-language access and AI governance

The Quick Topic was designed to make natural-language questions more reliable by giving business-friendly names to fields, adding synonyms, clarifying concepts such as *deal revenue* and *conversion rate*, and excluding ambiguous fields that could cause Quick Chat to select the wrong definition. For example, customer annual revenue is deliberately distinguished from NovaTech's deal revenue, while resolution time, campaign response and conversion have explicit business meanings.

Quick Chat should be treated as a fast exploration layer rather than the final system of record. Straightforward questions about campaign channels, deal performance and support metrics can be answered conversationally, but cross-dataset questions remain more sensitive to field selection, joins and metric definitions. The dashboard should therefore remain the authoritative source for recurring executive KPIs, while chat is best used for ad-hoc follow-up questions that are subsequently verified against the relevant dashboard view.

Recommended next steps

1. **Marketing team:** Reduce or pause NovaEdge Awareness and model budget shifts towards higher-converting campaigns and channels. At the same time, confirm with Finance that attributed revenue captures the appropriate economic value before making large budget changes.
2. **Sales team:** Introduce a **60-day opportunity review threshold**, stage-age alerts and stronger early product-fit qualification. Sales managers should monitor the recent increase in deal-cycle duration weekly.
3. **Customer success team:** Treat **Authentication and Data Pipeline as priority reliability initiatives**, establish clear severity-based service levels, and review high-risk accounts regularly with Engineering, Support and Revenue leadership.
4. **Operations team:** Refresh the dashboard weekly, use it as the primary Monday revenue review, and use Quick Chat for exploratory questions rather than replacing governed dashboard metrics.

The intended result is a single decision-making environment that links acquisition, revenue and customer experience. Its greatest value is not simply consolidating three reports, but enabling NovaTech to identify where revenue is being lost, delayed or put at risk and assign a clear business response.
